

PRAMLINTIDE: DRAWING UP THE RIGHT DOSE

The following table shows how to draw up the correct dose of pramlintide by converting micrograms (μg) to units. It is usually best to draw up doses in a $\frac{3}{10}$ -milliliter (30-unit) U-100 insulin syringe to get an accurate dose. Use only the dose prescribed by your physician.

DOSE IN MICROGRAMS (μg)	AMOUNT TO BE DRAWN UP IN U-100 INSULIN SYRINGE (UNITS)
15	2.5
30	5
45	7.5
60	10
120	20
